1. The first part of the question is about the definition of a function. A function is a mapping from a set to a set. The domain is the set of all possible inputs, and the codomain is the set of all possible outputs. A function is defined by a rule that assigns to each element in the domain exactly one element in the codomain.
2. The second part of the question is about the graph of a function. The graph of a function is a set of points in the Cartesian plane. The x-axis represents the domain, and the y-axis represents the codomain. The graph of a function is a curve that passes the vertical line test. The vertical line test states that if a vertical line intersects the graph at more than one point, then the graph does not represent a function.
3. The third part of the question is about the domain and range of a function. The domain of a function is the set of all possible inputs, and the range of a function is the set of all possible outputs. The domain and range of a function are determined by the function's definition.
4. The fourth part of the question is about the composition of functions. The composition of two functions f and g is a new function $g \circ f$ defined by $(g \circ f)(x) = g(f(x))$. The domain of $g \circ f$ is the domain of f , and the range of $g \circ f$ is the range of g .
5. The fifth part of the question is about the inverse of a function. The inverse of a function f is a function f^{-1} defined by $f^{-1}(y) = x$ if and only if $f(x) = y$. The domain of f^{-1} is the range of f , and the range of f^{-1} is the domain of f . A function has an inverse if and only if it is one-to-one and onto.
6. The sixth part of the question is about the properties of functions. A function is one-to-one if and only if it passes the horizontal line test. A function is onto if and only if every element in the codomain has at least one pre-image in the domain. A function is bijective if and only if it is both one-to-one and onto.
7. The seventh part of the question is about the graph of a function. The graph of a function is a set of points in the Cartesian plane. The x-axis represents the domain, and the y-axis represents the codomain. The graph of a function is a curve that passes the vertical line test. The vertical line test states that if a vertical line intersects the graph at more than one point, then the graph does not represent a function.
8. The eighth part of the question is about the domain and range of a function. The domain of a function is the set of all possible inputs, and the range of a function is the set of all possible outputs. The domain and range of a function are determined by the function's definition.

The first part of the question asks for the
 definition of a function. A function is a
 set of ordered pairs where the first element
 of each pair is from a set A and the second
 element is from a set B. In other words, a
 function maps each element of A to exactly
 one element of B.

The second part of the question asks for
 the domain and range of a function. The
 domain is the set of all possible input
 values, and the range is the set of all
 possible output values.

The third part of the question asks for
 the graph of a function. The graph of a
 function is a set of points in a coordinate
 plane where each point represents an input-
 output pair. The graph of a function must
 pass the vertical line test.

The fourth part of the question asks for
 the equation of a function. The equation of
 a function is a mathematical expression
 that describes the relationship between the
 input and output values.

The fifth part of the question asks for
 the inverse of a function. The inverse of a
 function is a function that reverses the
 mapping of the original function.

The sixth part of the question asks for
 the composition of two functions. The
 composition of two functions is a new
 function that is formed by applying one
 function to the output of another.
